

ATTENDANCE

Instructor Manual

A step-by-step guide to using the BatStateU Attendance System —
from logging in for the first time to taking attendance with facial recognition.

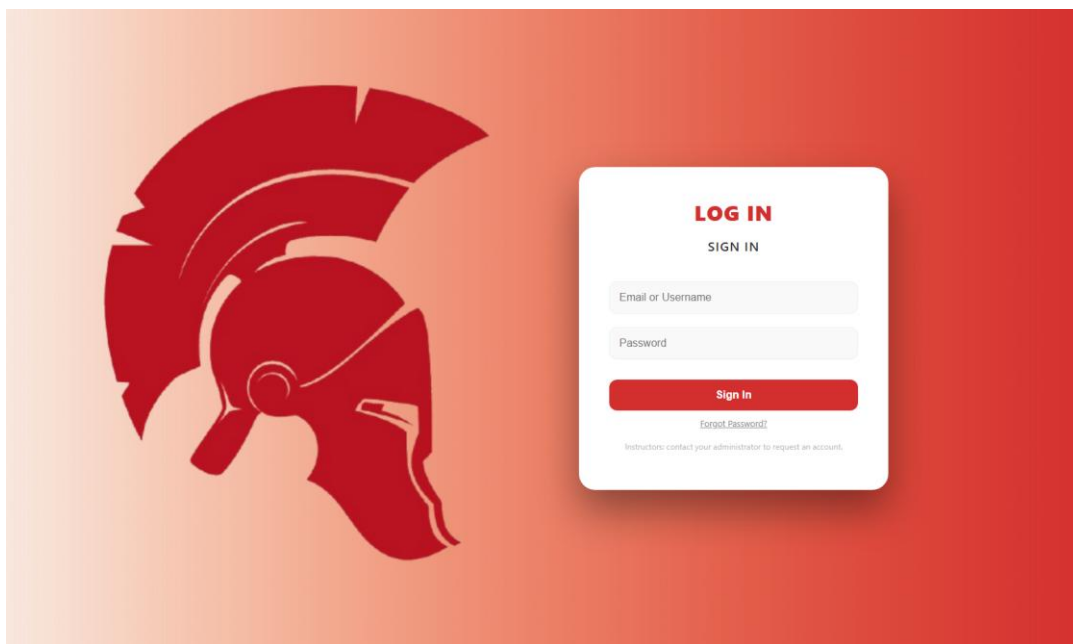

1. Introduction

This manual walks you through using the Attendance System as an instructor — from receiving your account and signing in for the first time, to creating classes, registering students, and recording attendance through facial recognition using the Local Station. Screenshots throughout this guide are taken directly from the live system so each screen matches exactly what you will see.

The system has two parts that work together: the cloud dashboard, which you use in any web browser to manage your classes, students, and reports; and the Local Station, a program installed on your classroom computer that runs the camera and performs attendance scanning.

2. Getting Your Account and Signing In

Instructor accounts are created only by the system administrator — there is no public sign-up option. Once your account is created, you will receive an email containing your login address and a temporary password. Open the link in that email to reach the sign-in page shown below.

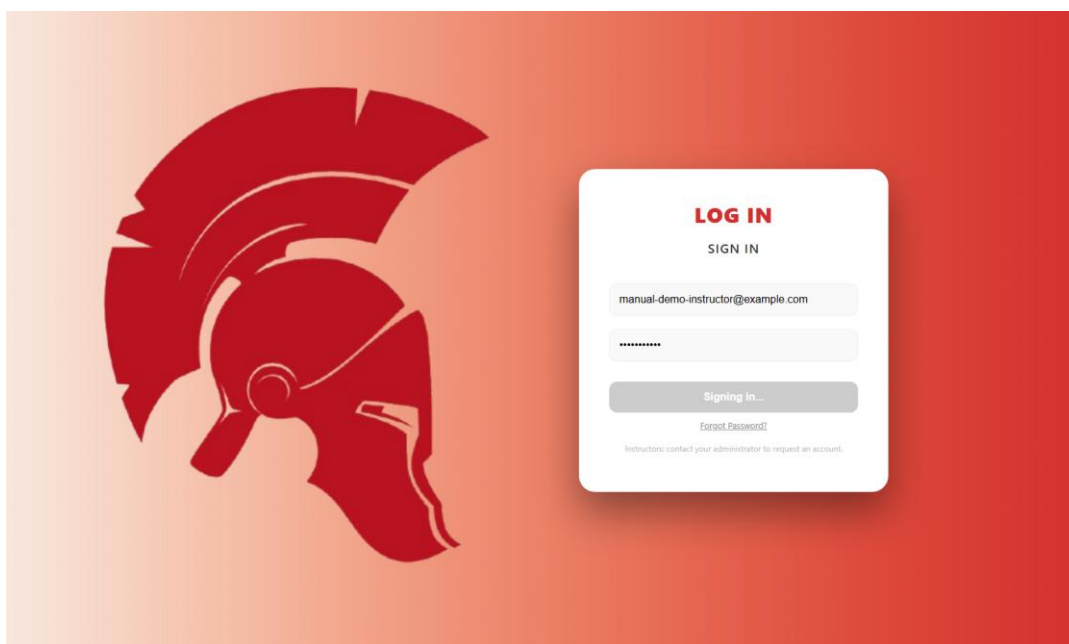

The sign-in page. Enter the email and password sent to you by the administrator.

If you ever forget your password, use the “Forgot Password?” link on this page. The system will email a one-time verification code to your registered address; enter it to set a new password. There is no way to change your password while already logged in — password changes always go through this reset flow.

3. Your Dashboard

After signing in, you land on your dashboard. This is your home screen — it summarizes your absence rates per class and your most recently saved attendance sessions. The right-hand panel always shows the current date and time, and a quick view of today's class schedule.

The instructor dashboard immediately after logging in.

4. Creating a Class

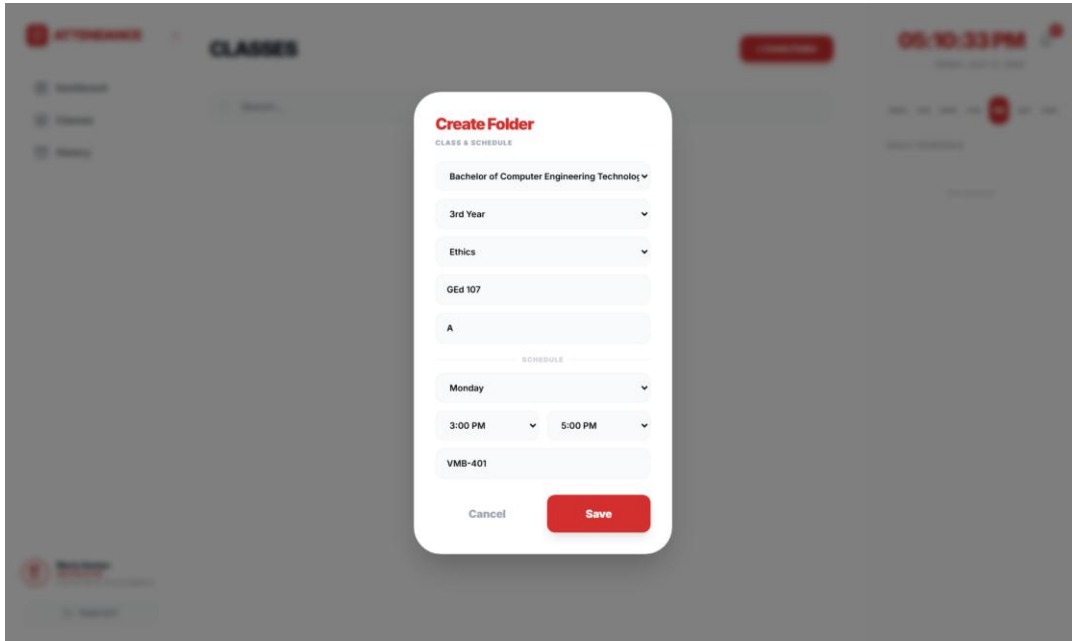

Open “Classes” from the sidebar, then click “+ Create Folder.” Each class you create acts as a folder containing that class's roster and every attendance session recorded for it.

The Classes page before any class has been created.

Fill in the program, year level, and subject (pulled from the curriculum your administrator has set up), then the course code and section. Finally, set the day, time, and room — this doubles as your weekly schedule

for that class. The system will warn you if the day and time you choose overlaps with another one of your classes.

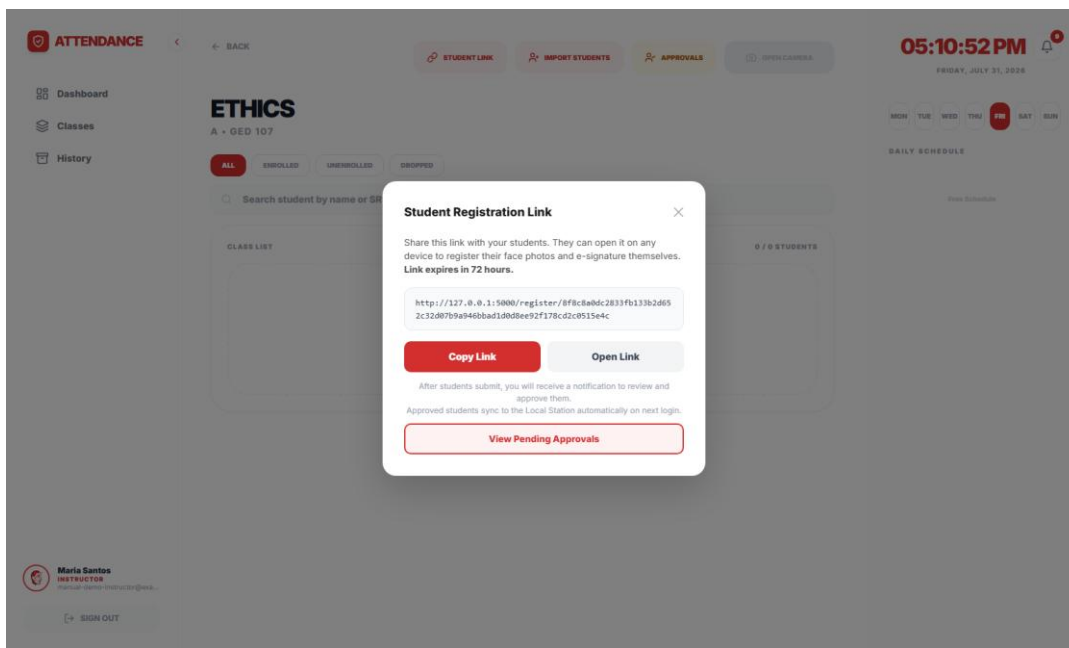

Creating a new class — program, subject, section, and weekly schedule are all set in one step.

Note: Keep the subject name and section reasonably short. Very long combinations can occasionally be rejected when saving — if that happens, simply shorten the section text and try again.

5. Sharing the Student Registration Link

Once your class exists, open it and click “Student Link.” The system generates a unique link for that class, valid for 72 hours, which you can copy and share with your students through any channel — a group chat, email, or posting it in class.

The Student Registration Link dialog, ready to copy and share.

Students open this link on their own device — no account of theirs is required. They enter their name, SR code, and email, then capture photos of their face from the front and, if possible, the left, right, and top angles, before submitting for your review.

Submit Registration

What a student sees when they open your registration link.

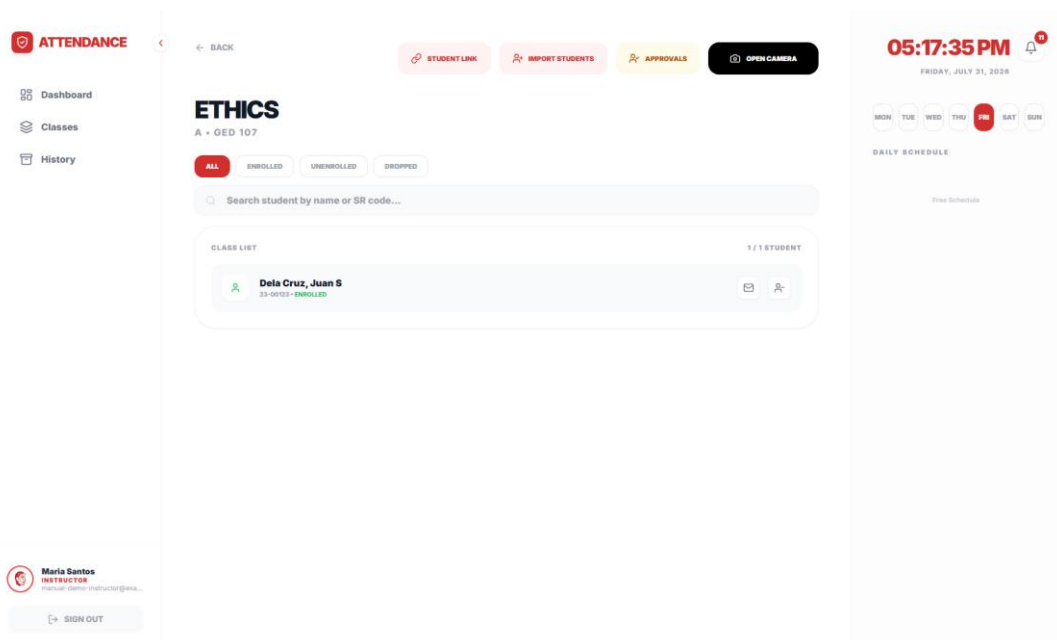

6. Reviewing and Approving Student Registrations

Every submission sits in a “Pending Approval” state until you review it — students are not added to your class, and cannot be recognized by the camera, until you approve them. Open “Approvals” from the class page to see everyone waiting for review, along with their submitted photos.

The Pending Approvals list for a class, showing a student awaiting review.

Click Approve to add the student to your official roster, or Reject to remove the submission entirely. Approved students are automatically made available to the Local Station the next time it syncs.

The class roster after a student has been approved — enrolled and ready for attendance.

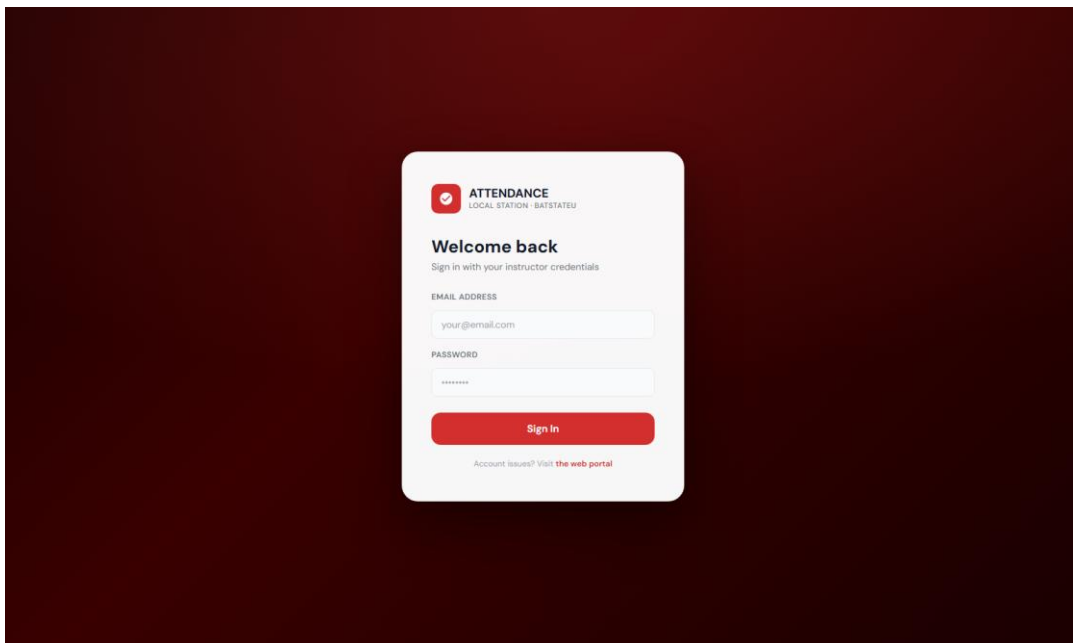

7. Installing the Local Station

Camera-based attendance requires the Local Station app to be installed on your classroom computer. This is a one-time setup done by your school's ICT/IT staff — you do not need to install it yourself. A separate, dedicated setup guide for ICT staff is available for download from your Profile page inside the system (see Section 11), so you can simply forward it to your IT department.

The cloud dashboard automatically detects whether the Local Station is running on the computer you're using. If it isn't detected, camera-related buttons stay disabled and a banner prompts you to open it.

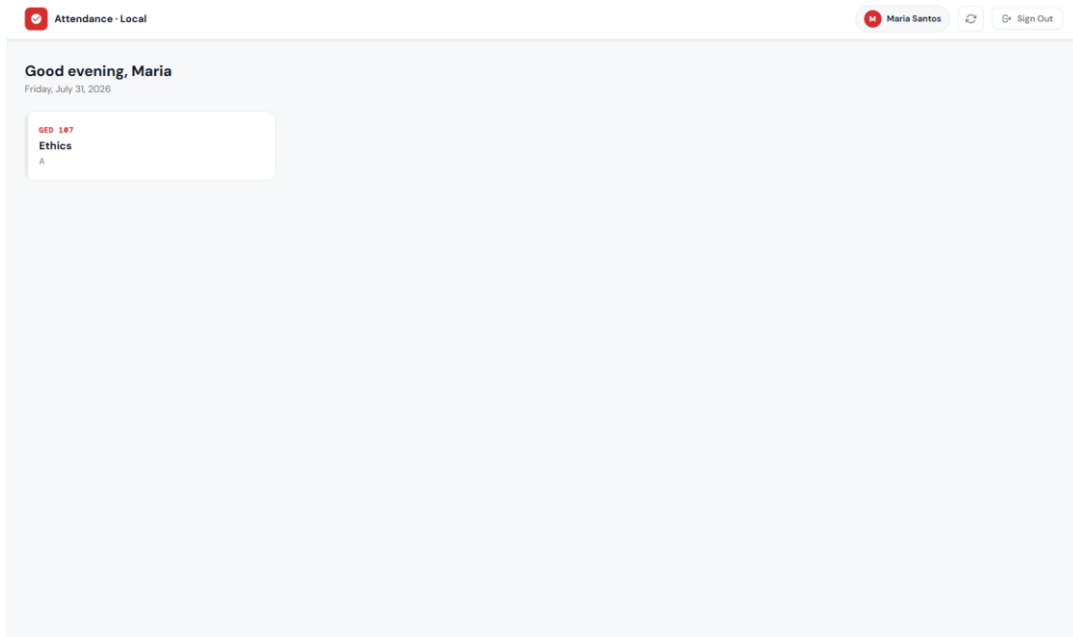

8. Signing Into the Local Station

Once installed, open the Local Station shortcut on the classroom computer. It uses the same email and password as your cloud dashboard account.

The Local Station sign-in screen.

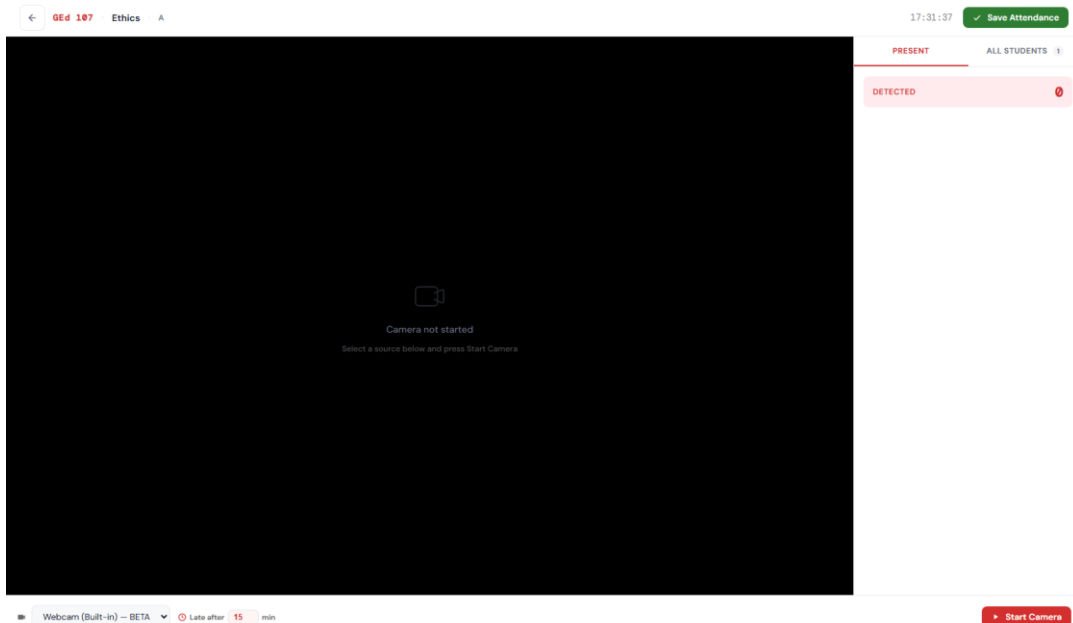

On first login each day, the Local Station syncs any newly approved students' face photos from the cloud so it can recognize them offline. After syncing, you'll see your schedule for the day.

The Local Station's class list after signing in.

9. Taking Attendance with the Camera

Open a class to reach the camera screen. Choose your camera source — the classroom's built-in webcam, or an IP camera configured by your administrator — and set how many minutes after the start of class a student should be marked “late.”

The camera screen before starting a session — select a source, then press Start Camera.

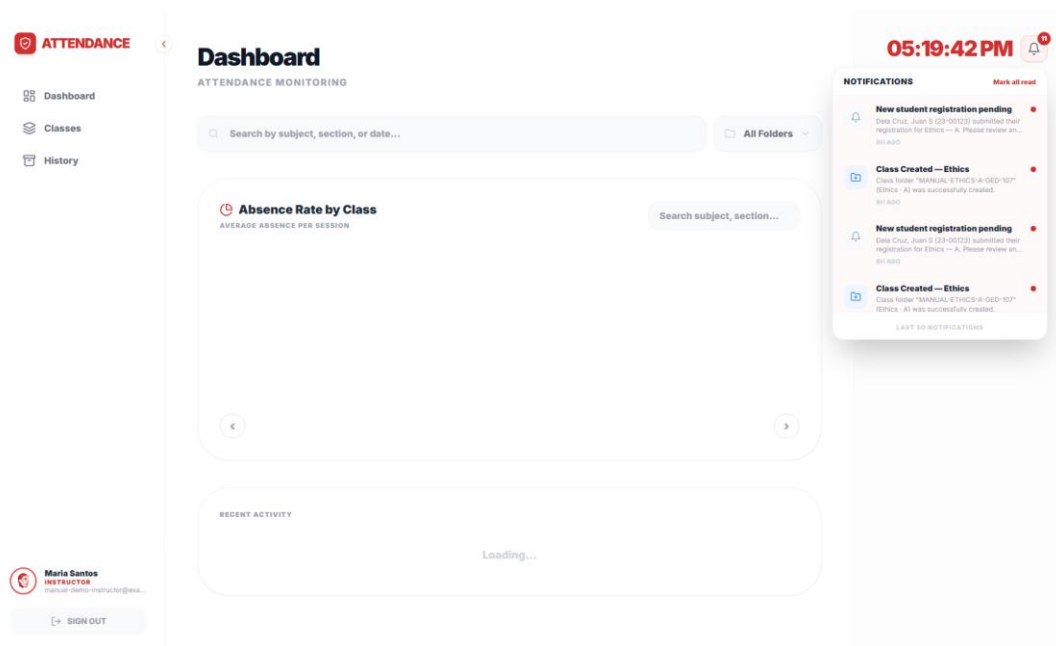

If you start the camera outside your class's normal scheduled time, the system will ask whether this is a make-up or rescheduled session and let you record the actual room and time being used, so it's flagged accordingly in your records.

While scanning, students are only marked present after being recognized consistently over several moments, to avoid a brief glimpse triggering a false detection. You can watch who has been detected so far, and see your full class roster at a glance, from the side panel.

When you're done, click “Save Attendance.” The system shows a summary of who was Present, Late, Partial, Excused, or Absent — you can manually correct any student's status or add a note before confirming. Only after you confirm is the record permanently saved.

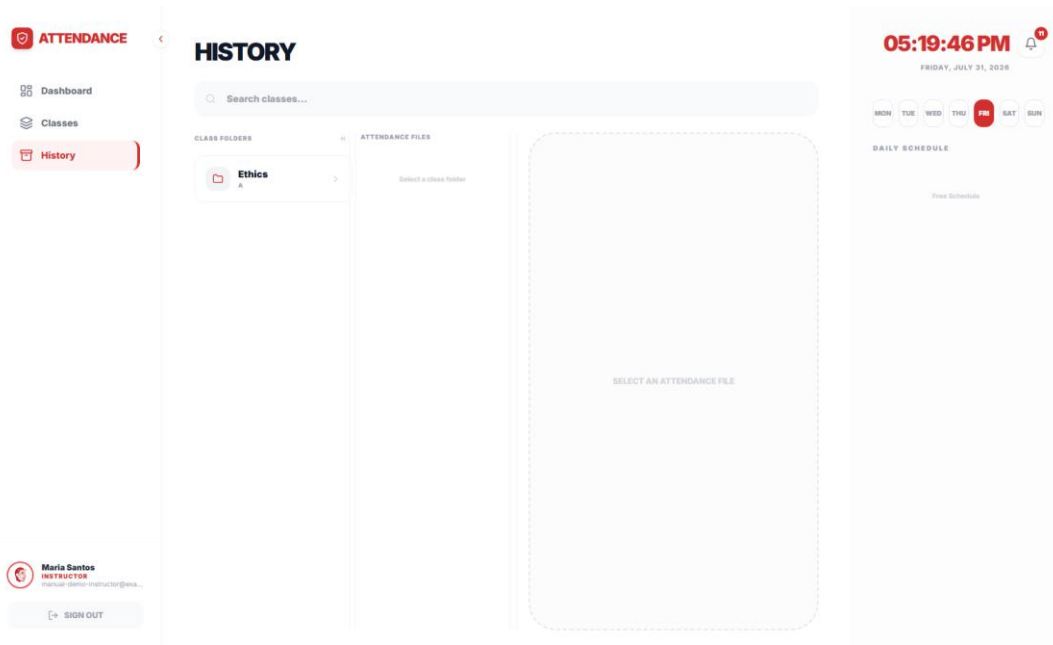

10. Notifications, History, and Reports

The bell icon in the top-right corner keeps you updated on important events — new pending registrations, saved attendance sessions, and more.

The notification panel, showing recent activity for a class.

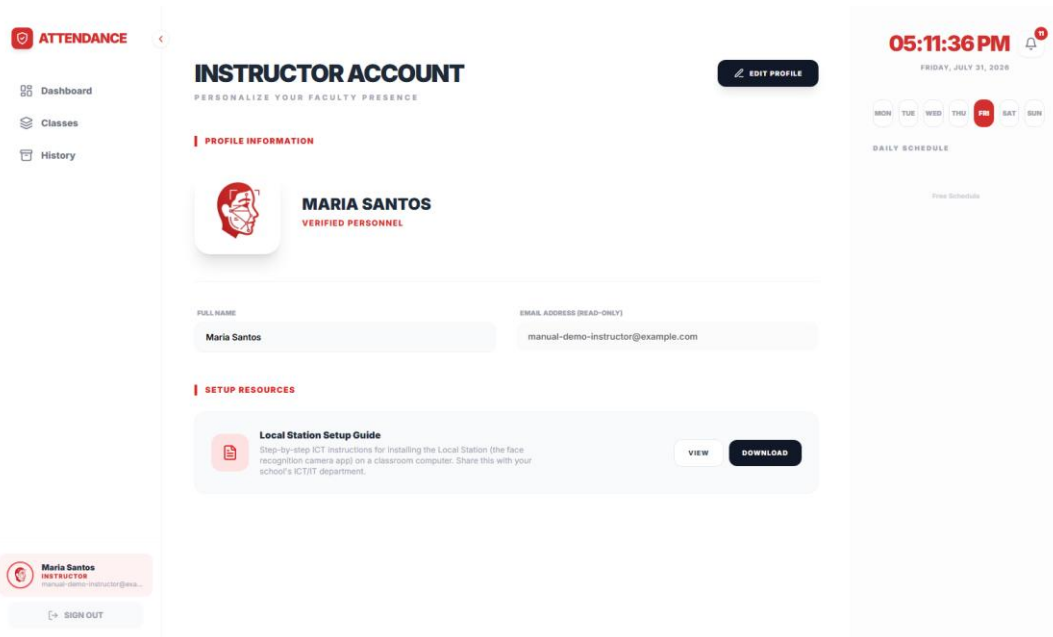

The History page lets you browse every attendance session you've ever saved, organized by class and date. Selecting a session shows each student's final recorded status, and you can generate a university-format attendance sheet (PDF) or a duration report (spreadsheet) from there.

The History page — browse past sessions by class and date.

11. Your Profile and Setup Resources

From your Profile page you can update your display name, contact number, and profile picture. Your email address and password cannot be changed here. This page also holds the Local Station Setup Guide — the same manual your ICT department needs to install the Local Station on a new classroom computer — available to view or download at any time.

Your Profile page, including the downloadable Local Station Setup Guide.

12. Signing Out

You can sign out of the cloud dashboard and the Local Station independently, from the button in the bottom-left corner of either app. For your security, you'll also be signed out automatically after a period of inactivity.
